Improving Postoperative Follow-up in Rural Rwanda: Detection and Referral for Surgical Site Infections Post-Cesarean Delivery

Bethany Hedt-Gauthier
Assistant Professor, Harvard Medical School
Research Advisor, Partners In Health/Rwanda

Co-PIs: Fredrick Kateera and Robert Riviello
Global access to surgical care

• As of 2015, an estimated 5 billion people do not have access to timely, safe, and affordable surgical and anesthesia care. (Meara 2015)

• 1/3 of the world’s population, primarily the richest, received ¾ of the 340+ million surgical procedures. (Grimes 2011)

• ¾ of deaths due to surgical emergencies happen in low and middle income countries. (Steward 2014)
Impoverishment due to surgery

- Proportion of population for whom paying for surgery would send below $1.25 PPP/day.
Surgical care in Rwanda

- 80% of surgeries happen in district hospitals.

- 60% of district hospital surgeries are C-sections.
  - Primarily performed by general practitioners.

- 75-90% of the population has *mutuelle* (public insurance) which would cover 90% of all medical costs.
Cesarean deliveries in rural Rwanda

Approximately 2% will have extended stays.

Discharged at ~ 3 POD
Delays for urgent cesarean deliveries

mHealth-CHW intervention study

Prospective study in Kirehe District, started in March 2017

• What happens to c-section patients after discharge?
• Can we better link those with complications, specifically Surgical Site Infections (SSIs), to care?
  • Utilizing community health workers (CHWs)

Aims:

1. Optimize a screening protocol that can be implemented by CHWs to identify SSI
2. Evaluate the impact of two CHW-mHealth interventions on a patient with a SSI returning to care
Two phases

SSI Screening Protocol

Optimization

Standard of Care

CHWs + Home Visits + Protocol

CHW + Phone Calls + Protocol

Phase 1

Phase 2
Methods – Phase 1

Prospective cohort study (Mar-Oct 2017) at Kirehe District Hospital

Included:
• Women who underwent CS
• At least 18 yo

Excluded:
• Non-residents of Kirehe
• Mahama refugee camp residents

Patients assessed at 10 Postoperative Days (+/- 3 PODs):
• CHW-administered 9 questions related to SSIs
• GP-administered 9 questions related to SSIs
• GP SSI diagnosis – **Gold standard**
Results

• 729 C-sections at KDH, of which 622 were eligible for follow-up.
  • 550 women screened (88.4%)
  • 10.9% developed an SSIs after discharge.

• Dataset split into two sets:
  • March-July used to develop a screening algorithm (n=294)
  • August-October used to validate screening algorithm (n=231)
Most predictive of GP-administered questions

SSI (n=31)

- Color of drainage
  - Bad color
    - Sens: 77.4%
    - Spec: 94.3%
  - Normal color
    - Gaping wound
      - + Gaping wound
        - Sens: 90.3%
        - Spec: 93.9%
    - No gaping wound
    - Pain
      - + Pain
        - Sens: 90.3%
        - Spec: 92.0%
  - No pain
    - No pain
      - + Fever
        - Sens: 96.8%
        - Spec: 86.7%
    - No fever
      - + Fever
        - Sens: 96.8%
        - Spec: 85.6%
    - No fever
Most predictive of CHW-administered questions

SSI (n=31)

Color of drainage

- Bad color
  Sens: 80.7%
  Spec: 82.1%

- Normal color

  Pain

    + Pain
    Sens: 83.9%
    Spec: 78.3%

    No pain

    Fever

      + Fever
      Sens: 83.9%
      Spec: 76.8%

      No fever

      Pain

        + Pain
        Sens: 87.1%
        Spec: 73.8%

        No pain
Results

• Selected three questions most predictive of SSI: Purulent drainage, fever, or increasing pain

• In validation dataset:
  • GP: sensitivity=95.2%, specificity=83.3%
  • CHW: sensitivity=76.2%, specificity=81.4%
Predictors of SSIs - preliminary

The following factors were significantly associated with SSI:

- weighing more than 75kg: OR=22.0, p=0.006
- spending more than $1.25 while traveling to health center: OR=3.53, p=0.016
- housewives (compared to farmers): OR=6.8, p=0.004)

Neither receiving preoperative antibiotic nor postoperative antibiotic was associated with presence of SSI.

Are we effectively preventing infections?

Layout of Postpartum Maternity Ward – WASH resources

Led by K. Robb
WASH Variability assessment:

• Data collected from Feb. 1\textsuperscript{st} – Mar. 30\textsuperscript{th}, 2018
• Collected every day in morning, afternoon, and evening
• Times selected to capture range of activities within postpartum ward

\textbf{Morning (9am):} This time-point coincides with medical rounds. Doctors and nursing staff are present. The morning cleaning has been completed, the patients have eaten breakfast, and some are resting. No family caregivers are present.

\textbf{Afternoon (2pm):} This time-point coincides with visiting hours. Family caregivers are present and mothers are eating lunch. Nurses and cleaners are also present.

\textbf{Evening (7:30pm):} This time-point coincides with dinner-time for mothers. Family caregivers who will spend the night are present and nurses are leaving for their own dinners. Cleaners are also present.
Water Access

![Bar chart showing water access categories: Drinking Water, Piped Water Flowing, Stored Bathing Water. Categories are compared acrossOverall, February, March, and Morning.](Image)
Conclusions

- High rates of SSIs, that need to be identified early to lower morbidity and mortality.
  - mHealth-CHW randomized trial underway

- Antibiotic prescribing deviates from international guidelines.
  - What are the appropriate prescribing practices?
  - How can we standardize?

- WASH resources are available, but variable.
  - Can we improve WASH to decrease infections?
  - How can we standardize?
